Expt-3:

Map Reduce program to process a weather dataset.

AIM:

To implement MapReduce program to process a weather dataset.

PROCEDURE:

1. **Create Weather Dataset**:

   nano weather_data.txt

   Example content:

   20220101 30.5

   20220102 29.8

2. **Mapper Program (mapper.py)**:

   ```python
   #!/usr/bin/env python3
   import sys
   for line in sys.stdin:
       line = line.strip()
       month = line[4:6]  # Extracting month
       temp = line[7:11]  # Extracting temperature
       print(f'{month}\t{temp}')
   ```

3. **Reducer Program (reducer.py)**:

   ```python
   #!/usr/bin/env python3
   import sys

   current_month = None
   current_max_temp = -float('inf')

   for line in sys.stdin:
       line = line.strip()
       month, temp = line.split('\t')
   ```

```python
        try:
            temp = float(temp)
        except ValueError:
            continue

        if current_month == month:
            current_max_temp = max(current_max_temp, temp)
        else:
            if current_month:
                print(f'{current_month}\t{current_max_temp}')
            current_month = month
            current_max_temp = temp

    if current_month == month:
        print(f'{current_month}\t{current_max_temp}')
```

4. **Run the Program**:

```
hdfs dfs -mkdir /weatherdata

hdfs dfs -copyFromLocal weather_data.txt /weatherdata

hadoop jar $HADOOP_HOME/share/hadoop/tools/lib/hadoop-streaming-*.jar \

-input /weatherdata/weather_data.txt \

-output /weatherdata/output \

-mapper mapper.py \

-reducer reducer.py
```

5. **Check Output**:

```
hdfs dfs -cat /weatherdata/output/part-00000
```

OUTPUT:

```
vruthi@Ubuntu:~$ hdfs dfs -cat /weatherdata/output/part-00000
2024-09-23 01:34:15,049 WARN util.NativeCodeLoader: Unable to load native-hadoop library for
01      -2.9
02       9.3
03      10.4

07      28.2
08      28.4
```

RESULT:

Thus, the program for weather dataset using Map Reduce has been executed successfully.
